

Roqos® Announces VPN and Dynamic DNS Services

Tysons, VA – April 6, 2017 – Roqos, an innovative leader in residential cybersecurity and parental controls markets, announced that Virtual Private Network (VPN) and Dynamic DNS services are now available on the Roqos Core router. Roqos customers can easily connect to their routers from anywhere in the world to have secure and private Internet experience.

“We are proud to be the first cybersecurity company for the residential market to offer VPN and Dynamic DNS services via Roqos Core routers,” said Sezen Uysal, founder and CEO of Roqos. “Our customers’ Internet privacy is very important for us. We’ve delivered VPN feature to ensure the privacy of our customers while they are in any public network.”

Coupled with VPN, Dynamic DNS service allows Roqos customers to access their home networks by a hostname that they choose, rather than IP addresses that are frequently changed by ISPs.

Some of the benefits of Roqos’ VPN are:

- **Private Internet in Public Wi-Fi:** Roqos VPN provides private Internet experience in all public Wi-Fi networks by encrypting Internet connections.
- **Access Content From Anywhere:** Roqos customers can stream HD content from service providers or from their media players while they are anywhere in the world.
- **Parental Controls Away From Home:** Roqos VPN app installed on kids phones provides continuous parental controls even while kids are away from home.
- **Most Secure:** As opposed to most VPN services hosted by some international companies with their servers in unknown locations, Roqos VPN server is at the most secure location, at the homes of Roqos customers.

Roqos VPN and Dynamic DNS features are available now for all existing customers without additional fee.
